GENERATING SUMMARIES FOR SOFTWARE COMPONENT INSTALLATION

ABSTRACT

[44]   Methods, systems, data structures and computer program products are provided for deploying software components, including deploying components in an enterprise environment.   Installation of components is initiated and a level of detail to be reported is selected. As installation progresses, a report is generated regarding the status of the installation of the components.   A portion of the report is displayed identifying the components at the selected level of detail and the corresponding status. Thus, a user may select only that level of detail which is of interest.
